REASONS FOR ALLOWANCE

1. Claims 1-4 and 15-16 are allowed.

2. The following is an examiner's statement of reasons for allowance:

The allowability resides in the overall structure of the device as recited in independent claim 1, and at least in part because claim 1 recites: "A base plate for a power module comprising: a metal plate; a ceramic base plate that is joined to the metal plate and contains X as an element selected from the group consisting of aluminum and silicon; and a release agent which includes boron provided in a joint surface between the metal plate and the ceramic base plate, wherein a remaining amount of the release agent is less than 5 as an amount of boron measured by fluorescence X-ray analysis, a ceramic crystal grain straining region in the joint surface of the ceramic base plate is equal to or less than 40%, and the amount of boron is defined as a value obtained by an expression: (a peak height of B- Ka / a peak height of X-Ka) x 100000." (emphasis added). The aforementioned limitations in combination with all remaining limitations of claim 1, are believed to render the claim and all claims dependent therefrom (3-4) patentable over the art of record.

The allowability further resides in the overall structure of the device as recited in independent claim 2, and at least in part because claim 2 recites: "A base plate for a power module comprising: a metal plate; a ceramic base plate that is joined to the metal plate and <u>contains X as an element selected from the group consisting of aluminum and silicon</u>; and a release agent which includes boron provided in a joint surface between

the metal plate and the ceramic base plate, wherein <u>a remaining amount of the release</u> <u>agent is less than 5 as an amount of boron measured by fluorescence X-ray analysis,</u> <u>an amount of ceramic crystal grain straining in the joint surface of the ceramic base</u> <u>plate is equal to or less than 0.03%, and the amount of boron is defined as a value</u> <u>obtained by an expression: (a peak height of B- Ka / a peak height of X-Ka) x 100000</u>." (emphasis added). The aforementioned limitations <u>in combination</u> with all remaining limitations of claim 2, are believed to render the claim and all claims dependent therefrom (15-16) patentable over the art of record.

Page 3

3. In addition to the previously cited references, the examiner has also cited the following references as being pertinent to the present invention, which teach the joining of metal and ceramic plate elements: Fushii et al. (US 5,354,415), Hirose et al. (US 6,122,170), Sakuraba et al. (US 6,221,511), Hirashima et al. (US 6,309,737), Nagatomo et al. (US 6,310,775), Ohashi et al. (US 6,328,198), Hirano et al. (US 6,692,818), Shinosawa et al. (US 6,689,498), Nagase et al. (US 7,128,979), Lucke et al. (US 7,236,367), Osanai et al. (US 7,255,931), Karandikar et al. (US 7,270,885) and Osanai et al. (US 7,348,493).

None of the references cited during prosecution of the instant application, either taken alone or in combination, are believed to render the present invention unpatentable as claimed. In particular, it is believed that although the cited references appear to teach the general structure of a power module with a ceramic and metal plate, they do not teach "the synergistic effect of both required qualities of a remaining release agent

on the joint surface that is less than 5 as an amount of boron measured by fluorescence X-ray analysis and a crystal grain straining region that is equal to or less than 40% or crystal grain straining equal to or less than 0.03%" as claimed and as presented in Applicant's arguments (page 12).

Page 4

Furthermore, the Examiner has performed inventor and assignee name searches for possible double patenting issues. No documents with conflicting claims have been identified.
